PHASE 2: Database Conceptual Design

SECD2523 - 08 Database

SEMESTER I, SESSION 2023/2024

Lecturer: Dr. Noor Hidayah Zakaria

Group name: 6G

Group members:

IVLYN TAY WAN ROU	A22EC0168
JOLYN LIN XIN EN	A22EC0127
TAN YUN XI	A22EC0282
YAP JUN CHENG	A22EC0294

Table of Contents

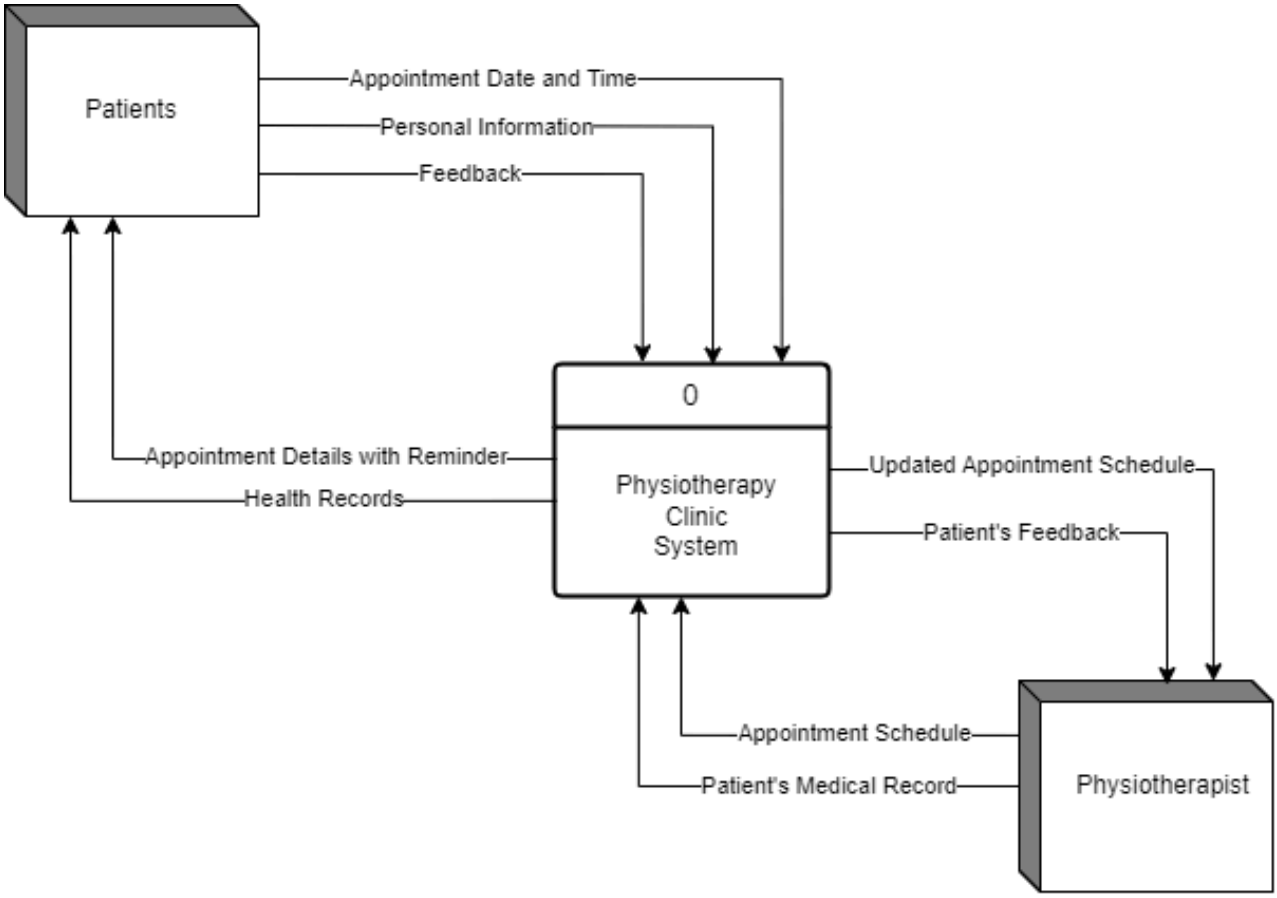
1.0 Introduction

In Phase 1, we conducted a thorough analysis of the challenges encountered by clinic staff and patients,which laid the foundation for developing the Physiotherapy Clinic Information Management System.We also gained a better understanding of the systemic issues that affect the clinic's operational efficiency and others hinder problems in patient engagement. As we enter Phase 2, our focus is on carefully developing a conceptual framework that not only meets the specified requirements but also maintains scalability, adaptability, and user-friendly design. This conceptual diagram will form the foundation for the entire system architecture, guaranteeing a unified and practical solution to address the unique needs of clinic staff and patients.

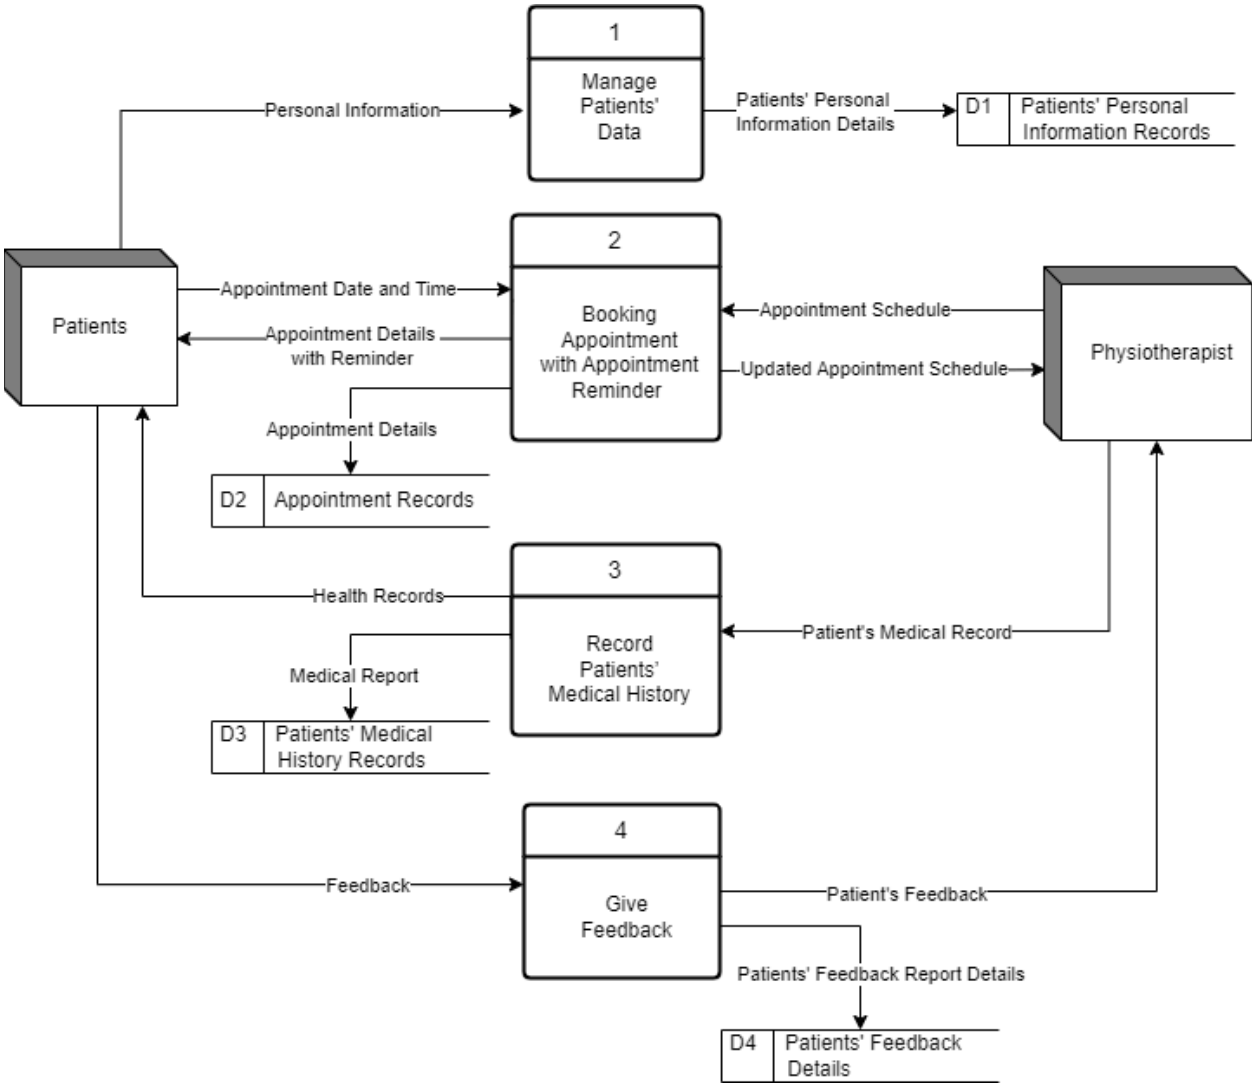
By outlining the connections among system components, data movement, and user interfaces, the conceptual diagram will offer a visual guide for the following development stages. It will clarify how automated appointment reminders, efficient patient record management, and improved accessibility, and the overall patient experience.This exploration aims to identify the constraints within the current database while understanding how a new system can effectively collect and manage data through its transaction requirements. The Entity-Relationship Diagram (ERD) plays a crucial role in providing a clear overview of the existing database system as we seek to understand how Physiotherapy Clinic Information Management System can achieve lasting success and growth with its current database structure.

2.0 DFD (to-be)

2.1 Context Diagram

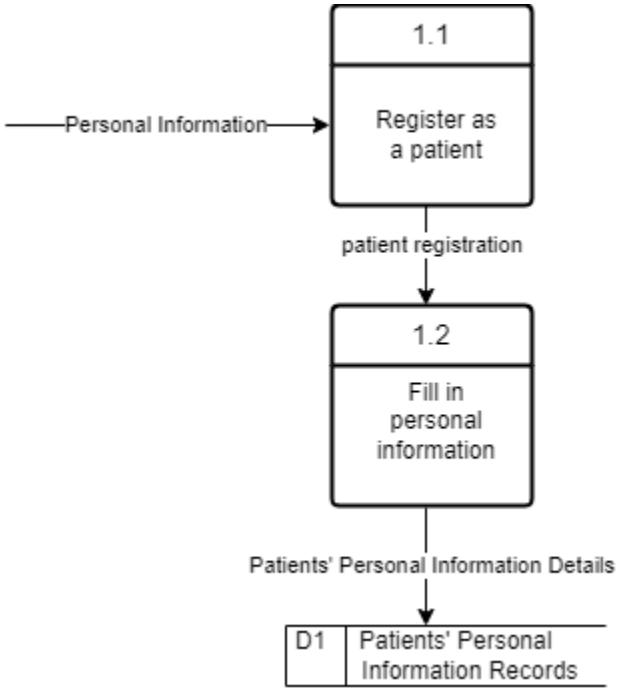


2.2 Level 0 Diagram

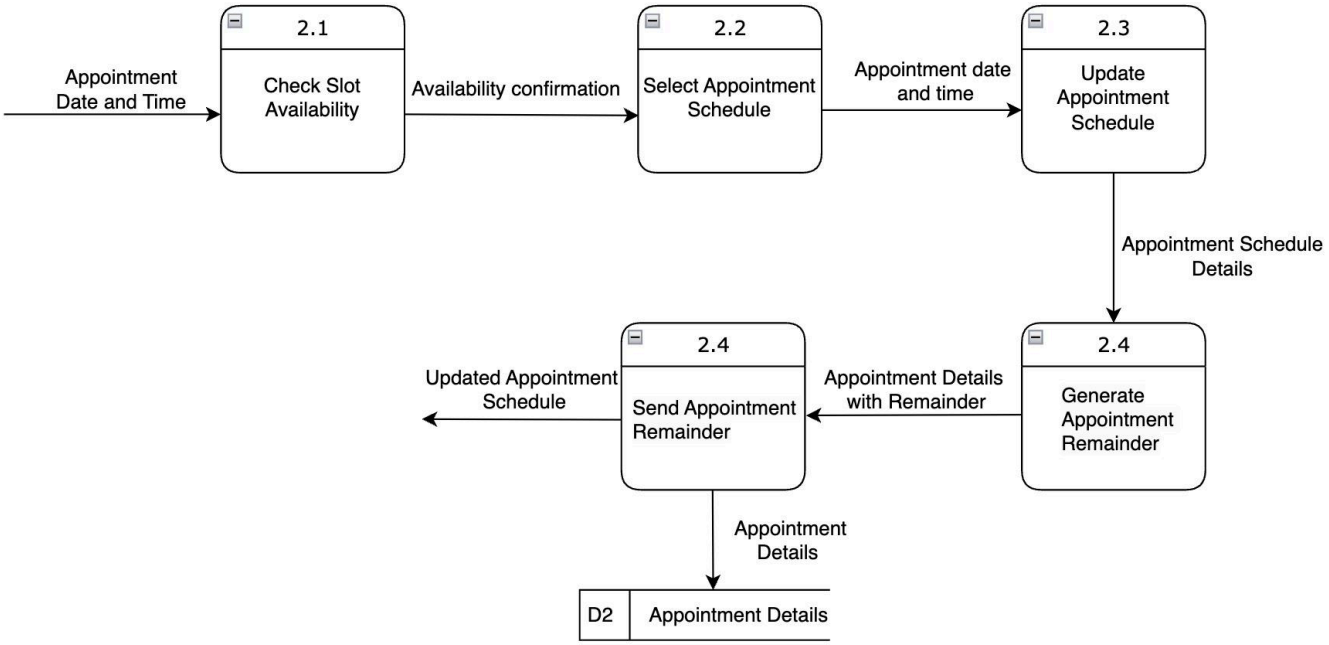


2.3 Level 1 Diagram

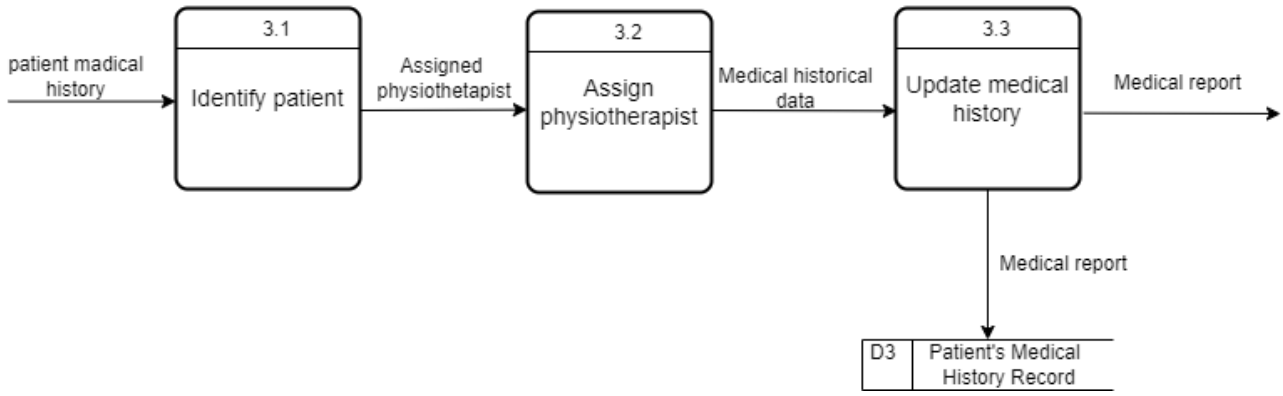
2.3.1 Process 1: Manage patients' data



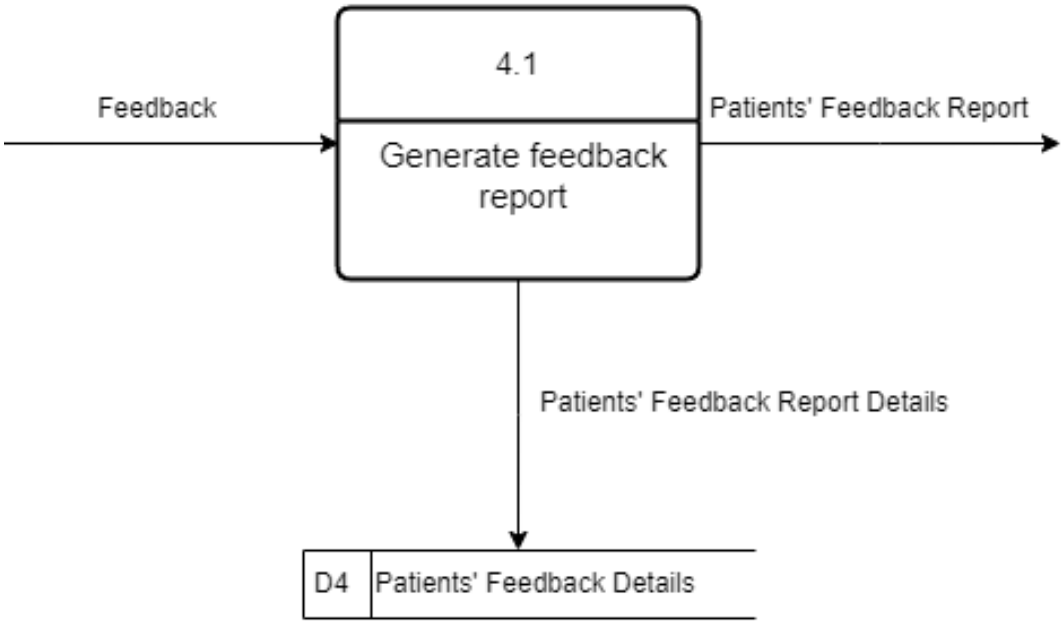
2.3.2 Process 2: Booking appointment with appointment reminder



2.3.3 Process 3: Record patients' medical history



2.3.4 Process 4: Give feedback



3.0 Data & Transaction Requirement

3.1 Proposed business rule

1.The system should automatically send appointment reminders to patients via email or SMS before the appointment within 3 days prior to the scheduled date and time.

2. The system identifies cases for the receptionist to proactively contact and reschedule if a patient misses two consecutive appointments, ensuring proactive patient engagement.

3. Patient records are stored securely for a minimum of 7 years after the last appointment in compliance with healthcare regulations, after which they are anonymized or securely deleted.

4.Each physiotherapist can manage up to three appointments per hour, ensuring sufficient time for personalized care and preventing practitioner overload.

5.A physiotherapist must create a treatment plan for each patient within 48 hours of the initial consultation.

6.Invoices for services rendered are generated within 24 hours of the appointment, with a 15-day payment window. Unpaid bills result in automatic reminders at 7-day intervals.

7.Users with administrative privileges can access compiled feedback reports, enabling the clinic to assess overall patient satisfaction and individual practitioner performance regularly.

8.The physiotherapist are able to view the feedback to follow up with the concerned patient regarding their experience or concerns.

9. Each patient can schedule multiple appointments across different departments.

10.Patients should have control over their data privacy and can choose to share or withhold specific information.

3.2 Proposed data and transactional

Proposed Data Requirement

Patient: The patient data store should include fields for personal information such as name, contact details, date of birth, address, and email. Additionally, it can store the medical history of previous injuries, allergies, treatment details, and appointment history.

Appointment: When the appointment is confirmed, the appointment details such as appointment ID, patient ID, physiotherapist ID, scheduled date and time, and appointment status should be stored in the appointment data table.

Reminder: The reminder data store contains patient ID, appointment ID, reminder ID, and physiotherapist ID. It will ensure that patients receive timely notifications about their appointments through their preferred communication method like email or SMS to help decrease the chances of missed appointments.

Medical Record: The medical record database should include fields for record ID, patient Physiotherapist ID ,consultation details, diagnosis and allergy. It is essential to maintain accurate and updated medical records to ensure continuity of care and facilitate effective communication between healthcare providers.

Physiotherapist: The physiotherapist database should include fields for personal information such as contact details, qualifications and physiotherapist ID. The availability schedule, specialized treatments or techniques offered, and patient feedback can also be stored in the physiotherapist database to help manage and assign appointments effectively.

Feedback: The feedback database should include fields for patient ID, appointment ID, feedback ID details such as rating or satisfaction score, comments or suggestions, and date submitted.

Proposed Transactional Requirement

Data entry:

- Enter the information of patients, including personal details, medical history, and contact information.
- Enter treatment details, such as types of therapy provided, duration, and progress of each session.
- Enter referral doctor information, including their name, specialty, and contact details.
- Enter the date and time for appointments, allowing patients to schedule their sessions conveniently.
- Enter personalized treatment plans for patients, outlining procedures, exercises, and progress tracking.
- Enter patient feedback, allowing them to provide comments and suggestions for improvement.
- Enter billing details including services rendered, charges, payment methods, and insurance claims for accurate financial records.

Data update/ delete:

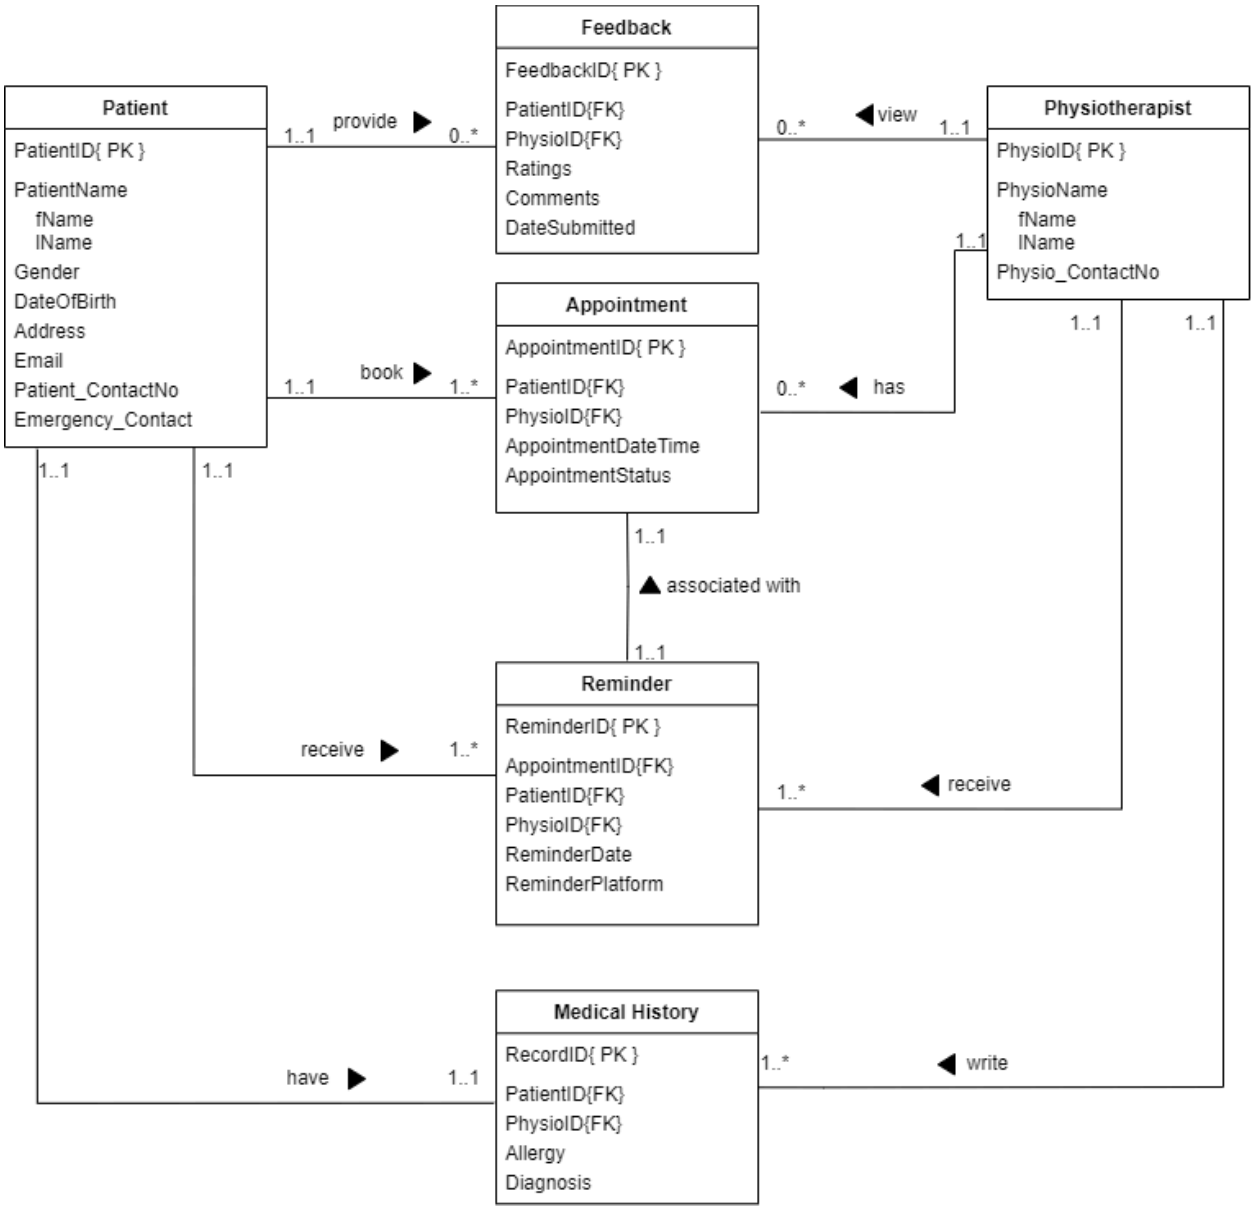
- Update/delete patient patient records with new medical information, changes in contact details, or insurance updates.
- Update/delete appointment details, such as dates, times, and treatment information.
- Update/delete physiotherapist information, including availability schedule and specialized treatments.
- Update/delete reminder settings, including delivery method and timing.
- Update/delete feedback information, including ratings, comments, and dates.
- Update/delete medical record information, including consultation details, diagnosis and treatment codes, physician notes, and attachments.

Data queries:

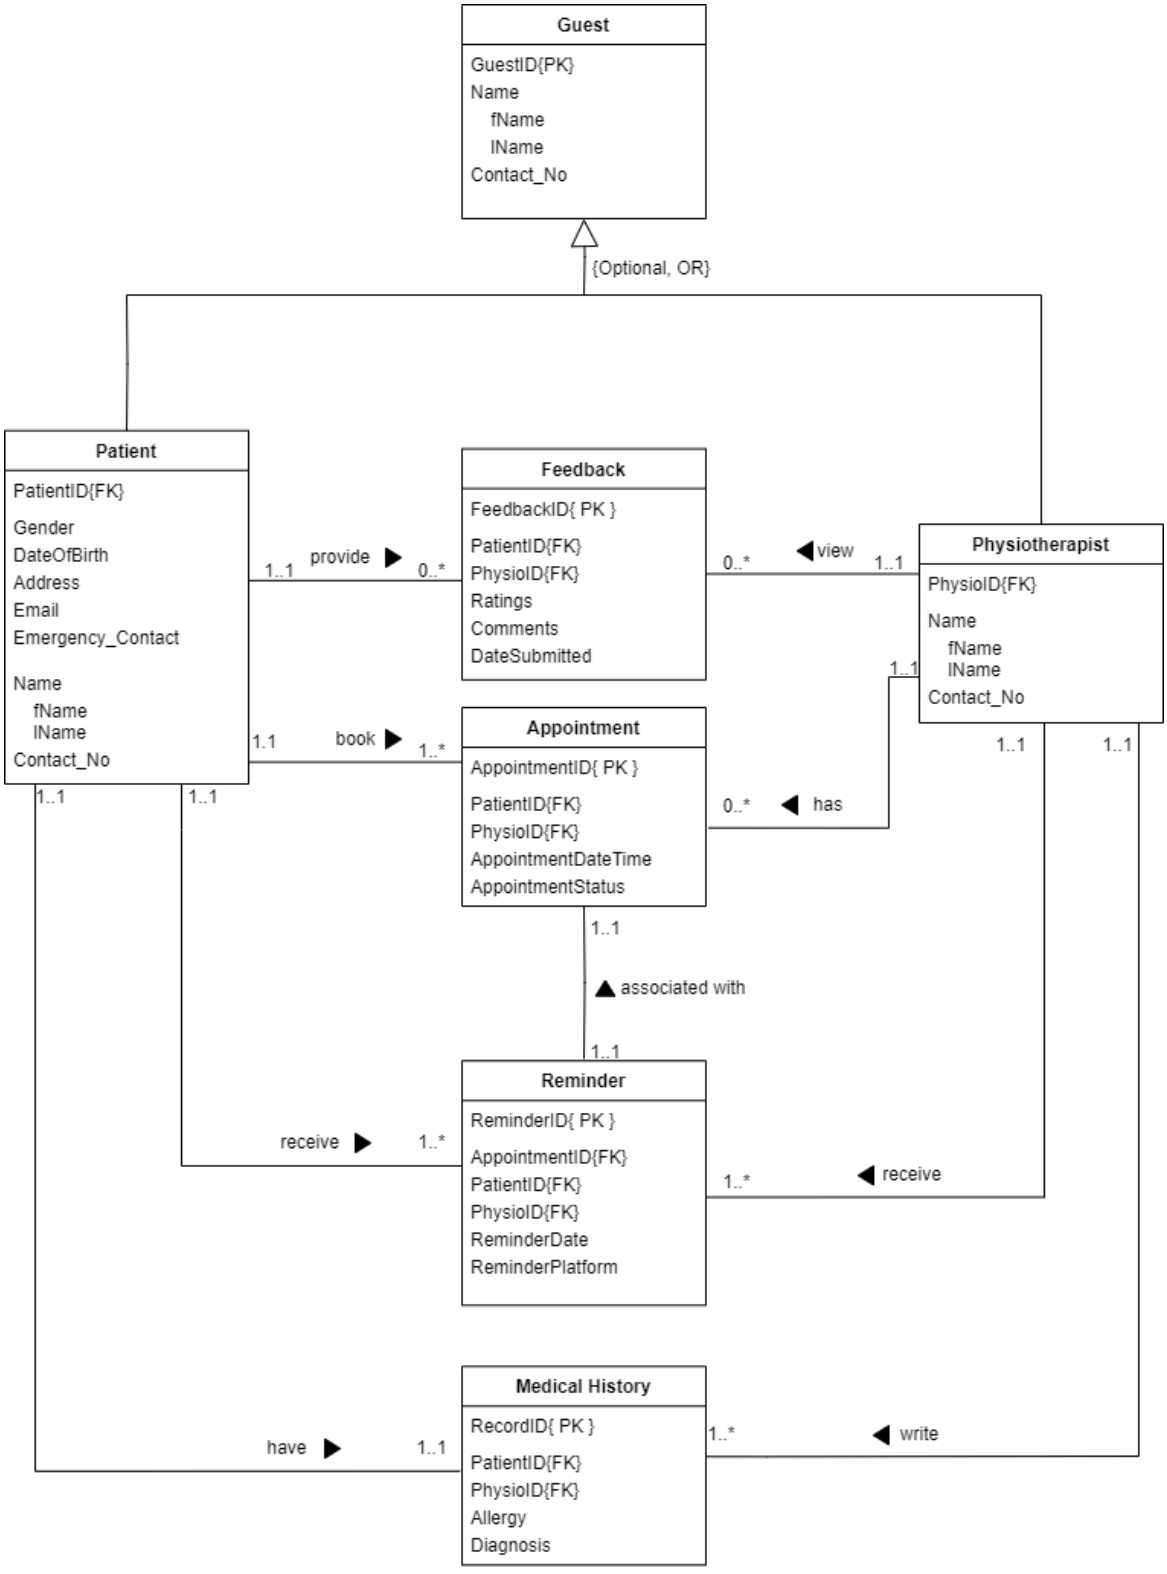
- List patient information, including personal details and medical history.
- List physiotherapist information, including availability schedule and specialized treatments.
- List medical record and reports information
- List appointment history, and treatment outcomes.
- Identify available time slots based on physiotherapist schedules and patient preferences.
- Identify patients based on specific criteria, such as age range or medical condition.
- Identify patients who have not attended appointments or have specific treatment needs.
- Identify insurance eligibility and benefits for patients based on their personal information and medical history.
- Display feedback information, including ratings and comments.

4.0 Database conceptual design

4.1 Conceptual ERD



4.2 Enhanced ERD (EERD)



5.0 Data dictionary

Relation: Guest

Entity	Attribute	Description	Data Type & Data Length	Constraint
Guest	Name fName lName ContactNo GuestID	 First name of user Last name of user Contact number of user Type of users	 VARCHAR2(20) VARCHAR2(20) VARCHAR2(15) VARCHAR2(20)	 NOT NULL NOT NULL NOT NULL PRIMARY_KEY

6.0 Summary

The new system for the physiotherapy clinic aims to address various shortcomings in the current setup, including occasional slowdowns and a lack of patient engagement features. As we completed this database requirement document, our team gained a better understanding of how the current database functions by outlining the Physiotherapy Clinic Information Management System. With data processes like entry, update/delete, and queries, the proposed system will enhance accuracy and efficiency in recording patient information while managing appointments and providing a platform for patient feedback. During development, our team recognized the importance of incorporating encrypted storage for patient information as well. Through AS-IS analysis data collections that included business rules and transaction requirements defined necessary functionalities for employment within this system proposal. To gather deeper logical knowledge about the existing set-up, we first analyzed these criteria before drawing Data Flow Diagram level 0 diagrams along with context diagram representations at level 1. The ERD representation illustrating entity relationships between patients, physiotherapists' appointments which helps visualize connections amongst different entities constituents stored inside databases.
